

1. Put your cuttings somewhere **warm and light-filled**, but with no direct sunlight, otherwise cuttings will cook in the warmer seasons. The warm and humid environment in the mini-greenhouse will help them grow

2. Watering. Keep the soil **moist but not wet** with very occasional misting from a spray bottle. Don't give them too much water or they may rot.

## Looking After Your Cuttings

3. **Be patient!** Cuttings can take 1-2 months to root. Look for roots coming out the bottom of the pots, and a small pair of leaves at the top of the cutting. This means that the cuttings are ready to put into larger pots of their own.

4. **Remove seedlings gently** using a bread knife (or you can make your own using a 10cmx 1cm piece of aluminium). Transfer them into small pots with potting mix. Keep them somewhere warm and dry and spray them gently with water.
